More particularly, the present invention is preferably applied to a fabrication method of a semiconductor integrated circuit device having a channel structure. In a field of a DRAM (Dynamic Random

Access Memory) using a Si substrate, a DRAM using a SOI (Silicon On Insulator) substrate has been proposed. The SOI substrate is fabricated by forming an SiO2 insulating film on an Si substrate and then forming a semiconductor film thereon, which is referred to as SOI. On the other hand, when a full well potential of a DRAM is formed in a source/drain region of a selection transistor to suppress a leakage current in a channel, one end of a source/drain region must be close to a source/drain region of a selection transistor formed on a silicon substrate to connect these sources/drains with the sources/drain regions of the selection transistors. Therefore, in

the DRAM using the SOI substrate, it is difficult to connect the SOI substrate with the silicon substrate by a source/drain diffusion region of the selection transistor or the impurity diffusion region of a depletion layer formed in the SOI substrate.Q: How to fetch all the dates for a week starting from the current date?
